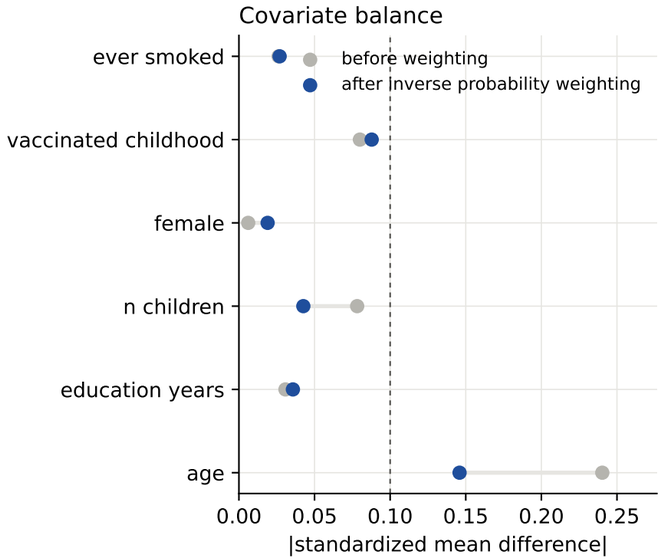
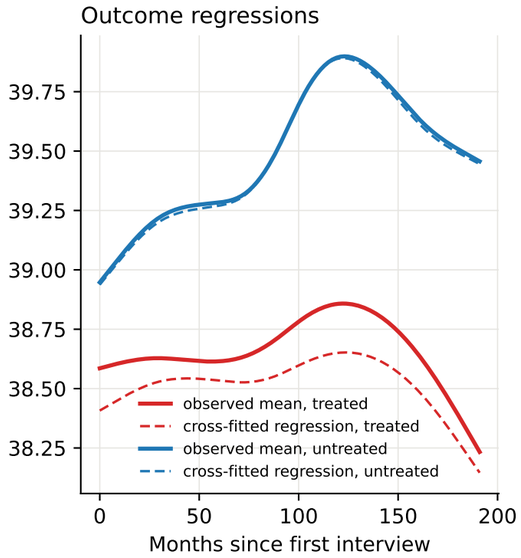
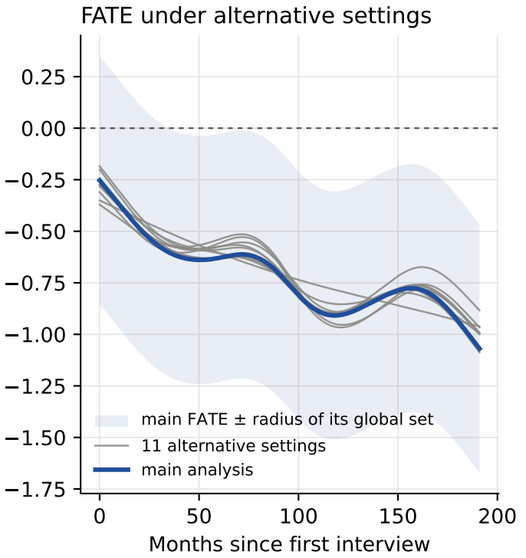
CASP: overlap
untreated (n = 1205)
treated (n = 313)
Subjects
Cross-fitted propensity score $\hat{\pi}(x)$



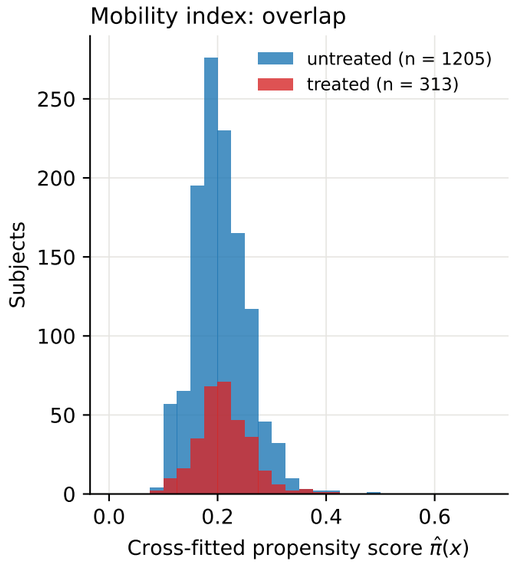
Covariate balance
before weighting
after inverse probability weighting
ever smoked
vaccinated childhood
female
n children
education years
age
|standardized mean difference|



Outcome regressions
observed mean, treated
cross-fitted regression, treated
observed mean, untreated
cross-fitted regression, untreated
Months since first interview



FATE under alternative settings
main FATE ± radius of its global set
11 alternative settings
main analysis
Months since first interview



Mobility index: overlap
untreated (n = 1205)
treated (n = 313)
Subjects
